

ABSTRACT

According to the present invention, when image data displayed on a monitor is linked with audio data using a digital recorder as a remote controller, an operator is permitted to sequence a plurality of image data to sequentially select the image data. After sound recording is started through the digital recorder, the operator turns on a shutter button of the digital recorder, thus closing an audio file and opening a new audio file. Further, the next image data is displayed. After that, the operator turns on a stop button of the digital recorder to return a screen to an edit screen. Then, all of audio files currently formed are connected to each other in the order of selection, the plurality of image data are linked as indexes with the connected audio files in the sequence such that each image data is inserted between the audio files, thus forming an audio album.
